Mapping the Left Periphery, the fifth volume in "The Cartography of Syntactic Structures," is entirely devoted to the functional articulation of the so-called complementizer system, the highest part of sentence structure. The papers collected here identify, on the basis of substantial empirical evidence, new atoms of functional structure, which encode specific features that are typically expressed in the left periphery. The volume also submits the richly articulated CP structure to further crosslinguistic checking. The research presented here has led to the identification of new, important restrictions in the relative sequence of elements appearing in the left periphery. With contributions from African languages, Chinese, Hungarian, Romance languages, and Italian dialects, Mapping the Left Periphery will be of interest to syntacticians working on comparative syntax, and more specifically on Romance grammar.

This book presents a thorough investigation of the main diachronic changes that have taken place in the palatal sounds of the Romance languages, as well as their current patterns of synchronic variation. André Zampaulo draws on extensive data not only from diachronic sources, but also from a range of current phonetic, phonological, and dialectal studies to motivate a formal, constraint-based account of palatal sound change. The analysis takes into account the role of phonetic information in the shaping of phonological patterns, approaching sound change from its inception during the speaker-listener interaction and formalizing it as the difference in constraint ranking between the grammar of the speaker and that of the listener-turned-speaker. The volume offers insights into how and why similar types of change may take place in different varieties and/or the same language at different times, and will be of interest to graduate students and researchers in historical linguistics, phonetics and phonology, Romance linguistics, and dialectology more broadly.
