more usual set theoretic concept of an element of a set to an object of any category. This idea often allows restating of definitions or properties of morphisms given by a universal property in more familiar terms, by stating their relation to elements. Some very general theorems, such as Yoneda's lemma and the Mitchell embedding theorem, are of great utility for this, by allowing one to work in a context where these tran

Theory-elements are elementary empirical theories in two senses. First, they are the smallest set-theoretical entities that may have empirical claims associated with them. Second, more complex, non-elementary, “molecular” empirical theories are all built from theory-elements that are linked in specific ways (Ch. IV).

The components of theory are concepts (ideally well defined) and principles. A concept is a symbolic representation of an actual thing - tree, chair, table, computer, distance, etc. Construct is the word for concepts with no physical referent - democracy, learning, freedom, etc. Language enables conceptualization.

Introduction to theory
The theory of five elements is extensively used in traditional Chinese medicine. It is proposed that the theory of five elements was developed on the basis of the theory of elements, the law of contagion and the law of similarity which were prevalent in that era. The theory of elements spread in various forms all over the face of the globe.
