Stochastic processes of importance in Finance and Economics are developed in concert with the tools of stochastic calculus that are needed in order to solve problems of practical importance. The financial notion of replication is developed, and the Black-Scholes PDE is derived by three different methods.

Solution 1: A Construction of Brownian Motion on  $[0;1)$  It is immediate that  $B_{\sim}(t) = 0$  and that  $B_{\sim}(t)$  is a Gaussian process with continuous paths. We also have  $E(B_{\sim}(t)) = 0$ , so we just need to check that  $E(B_{\sim}(s)B_{\sim}(t)) = s$  whenever  $0 \leq s \leq t$ . One does this simply by substituting the

Problem 5 Solution. Consider the event  $E_n = \{ \sum_{i=1}^n X_i > 2n \}$  and let  $N$  be the least  $n$  such that  $E_n$ . If we set  $p = P(E_n)$ , then  $P(N > k) = p^k$  where  $p = 1 - p < 1$ , and we find  $E(N) < 1$ . This implies  $P(N < 1) = 1$ , and since  $N \geq 0$  this
